

You are the lead engineer for this project.

The following architecture has been APPROVED and is now LOCKED.

PROJECT: Premium DJ portfolio / EPK / booking website.

PRIMARY GOAL: Build a visually exceptional, mobile-first, ultra-fast DJ website with minimal infrastructure and minimal running cost.

APPROVED STACK:

- Next.js
- App Router
- TypeScript
- Static export
- Tailwind CSS
- CSS variables for design tokens
- Lucide Icons
- Local typed configuration/data
- Cloudflare Pages for static hosting
- Cloudflare Worker/Pages Function for booking submission
- Resend for transactional email

IMPORTANT ARCHITECTURE RULE:

The Next.js application itself must remain statically exportable.

DO NOT implement a dynamic Next.js server backend.

DO NOT implement a Next.js API route that depends on runtime request data.

DO NOT add Firebase.

DO NOT add authentication.

DO NOT add a database.

DO NOT add CMS.

DO NOT add payments.

DO NOT add custom audio hosting.

DO NOT add a booking dashboard.

These are future-phase features.

BOOKING ARCHITECTURE:

Browser → booking form → Cloudflare Function / Worker → Resend → DJ/Agent email

The booking submission service MUST be isolated behind a clean frontend service abstraction so the UI does not depend directly on Resend.

CONTENT ARCHITECTURE:

All MVP artist content must come from strongly typed local TypeScript configuration.

Create clear data modules for:

- artist
- music
- events
- gallery
- social links

These structures must be designed so they can later be replaced by a CMS/database without rewriting the UI components.

SITE ARCHITECTURE:

Primary page: /

Sections:

about

music

events

gallery

booking

Dedicated routes: /music /events /press

Custom: /404

DESIGN LANGUAGE:

- premium underground electronic music
- dark industrial aesthetic
- editorial typography
- brutalist structural influence

- sharp geometry
- minimal rounded corners
- no generic SaaS look
- no generic AI landing-page look
- no excessive gradients
- no excessive glassmorphism
- no excessive animation

DESIGN TOKENS:

Background:

08080A

Surface:

111114

Active Surface:

1A1A1F

Border:

222227

Primary Text:

F2F2F5

Muted Text:

8C8C99

Live/Signal:

E02424

Action Accent:

CCFF00

TYPOGRAPHY:

Display: Syne or Space Grotesk

Body: Inter or Geist Sans

Metadata: JetBrains Mono or Space Mono

MOTION:

150–250ms. Sharp, intentional transitions. Respect prefers-reduced-motion.

PERFORMANCE:

- mobile first
- lazy load images
- WebP/AVIF where appropriate
- fixed image aspect ratios
- no autoplay video
- no heavy animation libraries
- no Three.js
- no heavy GSAP dependency
- third-party audio embeds must use click-to-load facades
- do not initialize external audio iframes until user interaction

ACCESSIBILITY:

Target WCAG 2.1 AA.

Requirements:

- semantic HTML
- keyboard navigation
- visible focus states
- correct labels
- accessible form errors
- reduced motion
- accessible image alt text
- descriptive iframe titles

IMPORTANT WORKFLOW:

DO NOT build the whole project yet.

FIRST:

1. Inspect the current project/workspace.
2. Create a concise implementation plan.
3. Confirm the architecture above is internally consistent.
4. Identify any conflicts.
5. Propose the exact folder structure.
6. Propose the required dependencies.
7. Do not install or write unnecessary packages.

8. Do not modify application code yet.

Then report:

A. Architecture validation B. Folder structure C. Dependencies D. Implementation phases E. Risks F.
Anything requiring a decision

STOP after the report.
